A;Title: Complete nucleotide sequence of immunoglobulin gamma2b chain gene clon A;Reference number: A02157; MUID:80120716; PMID:6766534
A;Contents: a allele
A;Contents: Contents: Contents:
                                                                                                                                                                                                                                                                                                        A;Introns: 138/1; 236/1; 258/1; 368/1
A;Introns: 138/1; 236/1; 258/1; 368/1
C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap C;Complex: An immunoglobulin cases, such as IgA and IgM, the subunits associate into la C;Superfamily: immunoglobulin C region; immunoglobulin homology
C;Keywords: alternative splicing: duplication; glycoprotein; heterotetramer; immunoglobulin; 157-222/Domain: immunoglobulin homology <IM1>
F;336-257/Region: hinge
F;381-350/Domain: immunoglobulin homology <IM2>
F;387-454/Domain: immunoglobulin homology <IM3>
F;152/Disulfide bonds: interchain (to light chain) #status predicted
F;144-220,288-348,394-452/Disulfide bonds: #status predicted
F;247,250,253,256/Disulfide bonds: interchain (to heavy chain) #status predicted
F;324/Binding site: carbohydrate (Asn) (covalent) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A:Title: Mouse immunoglobulin allotypes: post-duplication divergence of gamma2a an A:Reference number: A26233; MUID:82173203; PMID:6803173

C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into C;Superfamily: immunoglobulin C region; immunoglobulin homology C;Keywords: duplication; glycoprotein; heterotetramer; immunoglobulin F;20-85/Domain: immunoglobulin homology <IMIX.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A; Molecule type: protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of this sequence, the complementarity determining regions (CDRs) coriginates from murine monoclonal antibody 3D6 and the framework region originates from human germline VH segment DP-45 and J segment JH4. Novel humanised antibodies of the invention have CDRs from 3D6 and human framework sequences. These humanised antibodies have binding affinities (affinity and epitope location) approximately the same as those of the mouse 3D6 antibodies, The invention includes antibodies, single chain antibodies, and their fragments, as well as nucleotide sequences, vectors, transformed host cells, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise ameliorate symptoms and/or pathology associated with Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical cerebral amyloid angiopathy, and to inhibit formation or reduce Abeta plaque in the brain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antibodies that interact with osteoprotegerin ligands (OPGL). The antibody is useful for detecting the level of OPGL in a biological sample. The antibody, or the pharmaceutical composition comprising the antibody, is also useful for treating osteopenic disorder, an inflammatory condition with attendant bone loss, an autoimmune condition with attendant bone loss in a patient or rheumatoid arthritis in a patient. In particular, the antibody or composition is useful for treating bone diseases, e.g. osteoporosis, bone loss from arthritis, Paget's disease, osteopenia, endocrine osteoporosis (e.g. Cushing's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           syndrome or acromegaly), osteogenesis imperfecta, homocystinuria, wenkes' syndrome, Riley-Day syndrome, osteomyelitis, hypercalcemia, or osteonecrosis. The present sequence represents an anti-OPGL-1 antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Fig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antibodies that interact with osteoprotegerin ligands, useful for treating osteopenic disorders, e.g. osteoporosis, bone loss from arthritis, Paget's disease, osteopenia, osteomyelitis, hypercalcemia and osteonecrosis

chimeric anti-human firbrin heavy chain cDNA open reading chimeric anti-human firbrin heavy chain cDNA open reading chimeric Ab-producing transformant FIB1-HO1/X63 as a template to clone human C-kappa cDNA, using the oligo-dT (Fharmacia) primer as a primer for first strand cDNA synthesis and the 5'C2H and 3'EH cprimers for the PCR. A human gamma-1 chain CH2-CH3 domaine encoding cDNA was amplified. Similarly a human gamma-1 chain CH1 domain encoding cDNA and an anti-fibrin antibody VH cDNA and a leader peptide cDNA were amplified using the primers 3'EH; 3'C2H and 3'CH respectively as a primer for first strand cDNA synthesis and the primer combination of 5'C1H and 3'C2H, of 5'LH and 3'C1H and of 5'SH and 3'LH respectively as a primer for FCR. The amplified gene products were isolated and used to produce plasmids. After confirmation of the cDNA sequence of each plasmid, the cDNA encoding LH, VH, CH1 and CH2CH3 were joined toge!ther to give plasmid pTB1373 contg. the whole length chimeric II chain (LH, VH, CH1, CH2CH3), also abbreviated as IgH-FII,

                                                         Sequence
                                                                                           versus host disease, conjunctivitis, swemyocardial ischaemia or endotoxin shock is human AQC2 heavy chain protein.
                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel antibodies that specifically bind to very late activation (VLA-1; betal containing integrins) antigens and methods of using these antibodies to treat immunological disorders. The anti-VLA-1 antibodies are useful for preventing or treating VLA-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New anti-VLA-1 antibodies are useful for preventing or treating VLA-1-mediated immunological or inflammatory disorders, e.g. psoriasis, eczema, burns, dermatitis, and abnormal proliferation of hair follicle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       13-APR-2001; 2001US-283794P

The T84.12 antibody is directed against the tumour marker carcinoma embryonic antigen, and is useful for tumour imaging and immunotherapy. The amino acid sequence given in the specification has been incorrectly identified as a nucleic acid sequence, therefore unacceptable characters have been represented as an 'N'. The amino acid sequence given below has been derived from the cDNA, by the indexer.

Sequences of the invention are useful for manufacturing a medicament and for treating cancer including colorectum, non-small cell lung, breast, head and neck ovarian, lung, bladder, pancreatic cancer or metatatic cancers of the brain. They are also useful in antibody therapy. The present sequence is BIWAA/B antibody heavy chain mature protein. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antibodies CD44 gene, usef

The invention describes an isolated mucin-1-specific binding member having an antigen binding domain including a region that comprises a specific amino acid sequence. The inventive MUC1-specific binding member is used in the diagnosis and/or treatment of cancer, e.g. adenocarcinoma, found in various tissues, e.g. breast, ovary, bladder, and lung. It can be used alone or as a component in a more complex anti-cancer regimen which may contain anti-cancer drug(s) and/or radiation treatment(s). The inventive binding member recognizes tumour-associated MUC1 on adenocarcinoma. Its affinity is high enough to bind to tumour cells. This is the amino acid sequence of a mucin 1 (MUC-1) specific antibody region used to isolate MUC-1 antigen binding domains for use in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mucin-1-specific binding member; human; cancer; adenocarcinoma; breast cancer; ovarian cancer; bladder cancer; lung cancer; anti-cancer regimen; anti-cancer drug; radiation treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents the heavy chain variable region of a rat immunoglobulin G (IgG) antibody which is specific for the CD3 antigen complex, and the human CH1-hinge-aglycosylCH2CH3. The specification describes chimeric human/rodent anti-CD3 antibodies, which have a rodent CD3 light chain variable region and a human heavy chain variable region. The anti-CD3 antibodies can render T-cells non-functional by antibody blockade of the CD3 antigen-T-cell receptor (TCR) complex. They can be used for immunosuppression, particularly for the control of graft rejection. The antibodies can also enhance or re-direct T-cell responses to antigens. They can be used in the treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New humanized anti-CD3 antibodies, used for treating

                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated tumour-assoc:ated antigen mucin-1 (MMC-1)-specific binding member comprising an anti-gen binding domain (CC region having an antibody variable light (VL) or leavy (VH) region, CC or a complementarity determining region (CDR) of 'L or VH. MUCI-specific binding member is useful for diagnosing cancer, p:eferably adenocarcinoma CC binding member is useful for diagnosing cancer, p:eferably adenocarcinoma CC magnetic resonance imaging, scintillation counting, and x-ray film. CC magnetic resonance imaging, scintillation counting, and x-ray film. CC magnetic resonance imaging, scintillation counting, and x-ray film. CC denocarcinoma, in an individual, where the cancer is present in tissue CC of the breast, ovary, lung, or bladder of the individual. MUCI-specific binding member is useful for treating cancer, preferably CC cancer cells and tissues, for purifying or isolating mon-glycosylated, CC underglycosylated or cancer-associated forms of MUCI or MUCI-specific containing molecules, and for therapeutically or prophylactically cancer. The present sequence is human recombinant immunoglobulin CC (19) heavy chain region (variable VH and CH constant heavy chain).

The antibody is useful to inhibit and reduce the formation of amyloid plaques or the effects of toxic soluble Abeta species in humans their fragments are used for the manufacture of a medicant. This includes the prolonged expression of recombinant sequences of them in human tissues for the treatment of clinical/pre-clinical Alzheimer's disease, Down's syndrome or pre-clinical cerebral amyloid angiopathy. Specifically, the antibody is used to sequester Abeta into plasma, brain or cerebrospinal fluid to prevent/reverse accumulation of the Abeta peptide within the brain thereby improving cognition. The present sequence is the heavy chain of a humanised monoclonal antibody, Hu266, based on the mouse antibody 266.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of a preferred heavy chain of a chumanised antibody of the present invention. In the variable region of this sequence, the complementarity determining regions (CDRs) originate from murine monoclonal antibody 3D6 and the framework region from human germline VH segment DP-45 and J segment JH4. Novel humanised antibodies of the invention have CDRs from 3D6 and human framework sequences. These humanised antibodies have binding affinities (affinity and epitope location) approximately the same as those of the mouse 3D6 antibody. The invention includes antibodies, single chain antibodies, and their fragments, as well as nucleotide sequences, vectors, transformed host cells, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise ameliorate symptoms and/or pathology associated with Down's syndrome, (pre-)clinical angiopathy, and to inhibit formation or reduce Abeta plaque in the brain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                    The invention relates to polynucleotides encoding novel human CC proteins or their active domains. The polypeptides, polynucleotides and CC antibodies raised against the polypeptides are used in a method of CC treatment of a mammal and prevention of disorders caused by the aberrant CC protein expression or activity. The polypeptides can be used as CC molecular weight markers, food supplements, and in antibody production. CC The polypeptides are used to identify compounds which bind to the CC polypeptides. Polynucleotides of the invention are used as probes and CC primers, for sequencing, for chromosome or gene mapping, in the CC production of recombinant proteins, and in generating anti-sense DNA or CC RNA and in gene therapy. Polypeptides of the invention can be used to CC target drugs to a tumour, in assays to determine biological activity, to CC raise antibodies/elicit an immune response, to determine quantitative CC protein levels, as tissue markers, and to isolate receptors or ligands. CC Polypeptides of the invention may also be useful in treating platelet CC ligament and/or nerve tissue, wound healing, treating borns, promoting the part of the nortiferartion can be defermed and considers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          monoclonal rables virus neutralising antibody (virucide) derived from cDNA clones encoding the antibody heavy and light chains expressed in heterologous expression systems and purified away from deleterious contaminants. The invention provides a fused gene encoding a chimeric immunoglobulin light chain and a fused gene encoding a chimeric immunoglobulin heavy chain. The antibody of the invention is useful for treating an individual exposed to a rables virus by administering to the individual a therapeutically effective amount of the antibody, and preventing a spread of the rables virus to the central nervous system (CNS). The antibody of the invention provides a safe and efficacious p

CC The invention discloses a recombinant antibody comprising a constant CC region of monoclonal antibody (Mab) 57 linked to a non-Mab 57 variable CC region. Rabies is an acute, neurological disease caused by infection of CC the central nervous system with the rabies virus, a member of the CC Lyssavirus genus of the family Rhabdoviridae. Also disclosed are methods CC for producing an isolated recombinant antibody by culturing a host cell, CC containing a recombinant expression vector comprising the nucleic acid CC molecule encoding the antibody, and isolating the recombinant antibody CC expressed and treating an individual exposed to a pathogen by administering to the individual the recombinant antibody. The recombinant CC expressed to a pathogen, e.g. rabies infection. They are also useful for the qualitative and quantitative determination of the rables virus. The CC sequences presented are the antibody protein fragments, the nucleic acids CC encoding them or the PCR primers used to construct the recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 200
